# TAKE YOUR NEXT STEP
ON THE PATH TO IMPLEMENTATION

Why Go Digital?

Digital pathology is the practice of converting microscopic glass slides into digital slides that can be viewed, managed, and analyzed on a computer screen or mobile device. Digital pathology is being readily adopted by research organizations to enhance biomarker and drug discovery. Here are the top reasons to implement digital pathology.

IMPROVE QUALITY & PRODUCTIVITY

Reduced errors:
Helps prevent breaking of precious slides due to excess handling, and need to ship to distant laboratories. Misidentification may also be reduced by barcoding of slides.

Improved analysis:
Improve accuracy in tissue analysis by removing the subjectivity and inter-/intra-observer variability inherent in manual review, as well as providing a comprehensive, quantitative analysis.

A new way to view:
Team annotation of slides. Measure multiple areas of interest with multiple people annotating. Get a dashboard view of all annotations for analysis. Simultaneous view of slides from the same study.

More innovation:
Big data provides more research outputs for complex research questions. Allows research groups to collaborate at broader locations. Provides tools for teaching and training at different locations.

Improved workflow:
Central storage and data management systems for digitized slides enables international collaboration, a more streamlined workflow, and for more flexible work schedules.

Reduced turnaround time:
Enables immediate access to archived digital slides compared to searching in physical repositories. Also reduces time in retrieving, matching and organizing data within a study.

For research use only. Not for use in diagnostic procedures
